

Downloadwin

The Downloadwin utility is a Windows program that sends PCL bitmapped soft fonts to any Windows HP LaserJet or compatible printer. The printer must be PCL level 5 or above compatible. This utility runs in Windows 10, 8, 7, Vista, XP, & Server 2012 & 2008. You can select any ID number for the font and have access to any Windows printer.

For ease of use you can make a desktop shortcut to this program in XP by right clicking on the program file and selecting “Create Shortcut”. Drag this to your desktop. In Windows 10/8/7, right click on the program file and select the “Send to”, and the “Desktop”.

To download a font first specify the PCL font file to send to your printer. Enter the full path and file name in the box, or click on “**Select Font**” and select the individual font file.

Next select the printer to send the font to. The default printer for Windows appears by default. You can skip this step if you want to use the default printer. If you want to change the printer, click “**Select Printer**” and pick any printer from the list of current Windows devices.

Finally, every font sent to the printer must have a font ID. This number is assigned to the font when it is downloaded. Fonts may be selected based on their font ID or their font metrics. If two fonts are sent to the printer with the same font ID number, the last one sent will **overwrite** the first one! So every font sent to the printer must have a unique font ID number. Downloadwin starts with ID 1 and increments the number each time a font is sent to the printer. You can optionally enter any font ID number you like, from 0 – 32767. Note that Downloadwin does not remember the font ID numbers used between separate program runs.

Once you have specified the font, printer, and ID number click “**Download Font**”. The program will tell you when the font download is complete. At this point you can select another font to download or exit the program.
